

Proposal: Warehouse Visibility Platform for NordFrame Logistics

Submitted by: Clarion Data Systems (fictional)

Our Understanding

NordFrame's six warehouses currently rely on spreadsheets and a legacy system, making real-time visibility difficult. We will replace this with a unified dashboard.

Proposed Solution

- **Dashboard:** real-time inventory levels across all 6 warehouses, built on top of your existing PostgreSQL database — no database migration required.
- **Low-stock alerts:** configurable thresholds per item, notifying warehouse managers automatically.
- **Role-based access:** warehouse managers see only their own site's data; HQ staff have visibility across all sites.
- **Rollout approach:** we will onboard warehouses in phases rather than all at once, to reduce disruption during the transition.

Timeline

We will begin with discovery and design, followed by a pilot phase, and aim to complete full rollout within the timeframe you've outlined. Exact scheduling will be confirmed once we begin discovery.

Pricing

Our typical packages for a project of this scope range from €70,000 to €110,000 depending on final integration complexity. We will provide a firm quote after discovery.

Why Clarion

Clarion has delivered inventory and logistics dashboards for several mid-size distribution companies across the DACH region.
