

Request for Proposal — Warehouse Inventory Dashboard

Client: NordFrame Logistics GmbH (fictional) **Industry:** Logistics / Warehousing

Background

NordFrame Logistics operates 6 regional warehouses across Germany and Austria. Our current inventory tracking is split across spreadsheets and an outdated legacy system, making it hard to get a real-time view of stock levels across sites.

Requirements

1. A **web-based dashboard** showing real-time inventory levels across all 6 warehouses.
2. **Automated low-stock alerts** sent to warehouse managers when items fall below a configurable threshold.
3. Integration with our **existing PostgreSQL inventory database** — no migration to a new database.
4. **Role-based access** — warehouse managers should only see their own site; HQ staff should see all sites.
5. A **data migration / onboarding plan** for rolling this out across all 6 sites with minimal disruption.
6. **Support & maintenance terms** after go-live (response times, SLAs).
7. Clear documentation of any **assumptions, limitations, or risks**, since inventory decisions will be made based on this system.

Budget

€80,000–€120,000 total, including first year of support.

Timeline

Working pilot at one warehouse within 3 months; full rollout to all 6 sites within 6 months.

Decision Date

End of this quarter.
